

Recall Gauss's Theorem (Divergence Theorem):

$$\int (\vec{\nabla} \cdot \vec{A}) d\tau = \int \vec{A} \cdot d\vec{a} \quad (1)$$

&

Stokes Theorem (Curl Theorem):

$$\int (\vec{\nabla} \times \vec{A}) \cdot d\vec{a} = \int \vec{A} \cdot d\vec{l} \quad (2)$$

Here I present examples of the utility of these theorems.

I.a) Evaluate  $\int \vec{A} \cdot d\vec{l}$  along the path shown for  $\vec{A} = 2xy\hat{x} + x^2\hat{y}$

$$\begin{aligned} \oint \vec{A} \cdot d\vec{l} &= \int_1 \vec{A} \cdot d\vec{l} + \int_2 \vec{A} \cdot d\vec{l} + \int_3 \vec{A} \cdot d\vec{l} \\ &= \int_{0,0}^{a,0} \vec{A} \cdot d\vec{x} + \int_{a,0}^{a,a} \vec{A} \cdot d\vec{y} + \int_{a,a}^{0,0} \vec{A} \cdot (d\hat{x} + d\hat{y}) \end{aligned}$$

$$\int_1 ( ) = 0 \text{ bc } y=0$$

$$\int_2 ( ) = \int_0^a x^2 dy \Big|_{y=0}^{y=a} = a^3$$

$$\int_3 ( ) = \int_{a,a}^{0,0} 2xy dx + x^2 dy = \int_{a,a}^{0,0} 2x^2 dx + y^2 dy = -\frac{2}{3}a^3 - \frac{1}{3}a^3 = -a^3$$

where the equation of the line for 3 is  $x=y$ .

Summing everything  $\Rightarrow$

$$\boxed{\oint \vec{A} \cdot d\vec{l} = a^3 - a^3 = 0}$$

I.b) Use Stokes Theorem to evaluate I.a.

$$\oint \vec{A} \cdot d\vec{l} = \int (\vec{\nabla} \times \vec{A}) \cdot d\vec{a} = \int \epsilon_{ijk} \partial_j A_k d\vec{a}$$

$$\int \hat{z} (\partial_x A_y - \partial_y A_x) dx dy \hat{z} = \int (2x - 2x) dx dy = 0$$

II. a) Evaluate  $\int \mathbf{x} \cdot d\vec{S}$  over surface of cube of side  $a$ .

Since  $\hat{x} \cdot d\vec{S} = 0$  unless

$d\vec{S}$  is in  $\hat{x}$  (dot is, the  $yz$  plane)  
we only need to evaluate  $d\vec{S}_y$  &  $d\vec{S}_z$

$$\int \mathbf{x} \cdot d\vec{S}_y = \int (-a/2) dz dy \hat{x} \cdot (-\hat{x}) = a/2 a^2 = a^3/2$$

$$\int \mathbf{x} \cdot d\vec{S}_z = \int a/2 dz dy \hat{x} \cdot (\hat{x}) = a^3/2$$

$$\Rightarrow \int \mathbf{x} \cdot d\vec{S} = \sum_j \int \mathbf{x} \cdot d\vec{S}_j = a^3/2 + a^3/2 = a^3$$

II. b) Use Gauss to do above

$$\int \vec{A} \cdot d\vec{\omega} = \int (\nabla \cdot \vec{A}) d\tau = \int (2x) d\tau = a^3$$

For completeness we'll do one for Gradients, too.

Driffids 1.31 c Check Gradient Thm for  $T = x^2 + 4xy + 2yz^3$ ,

$$\vec{a} = \vec{0} \quad \vec{b} = \vec{i} \quad \text{path } z = x^2; y = x$$

$$\text{Gradient Thm: } \int_{\vec{a}}^{\vec{b}} (\nabla T) \cdot d\vec{\ell} = T(\vec{b}) - T(\vec{a})$$

$$a) \int_{\vec{a}}^{\vec{b}} (\nabla T) \cdot d\vec{\ell} = \int_0^1 (2x + 4y) dx + (4x + 2z^3) dy + 6yz^2 dz$$

$$\nabla T = (2x + 4y) \hat{x} + (4x + 2z^3) \hat{y} + 6yz^2 \hat{z}$$

$$(\nabla T) \cdot d\vec{\ell} = (2x + 4y) dx + (4x + 2z^3) dy + 6yz^2 dz$$

$$\text{using } \vec{r}: z = x^2, y = x, dz = 2x dx \quad dy = dx \Rightarrow$$

$$\int_{\vec{a}}^{\vec{b}} (\nabla T) \cdot d\vec{\ell} = \int_0^1 (6x dx + (4x + 2x^6) dx + 12x^6 dx$$

$$= \int_0^1 (10x + 14x^6) dx = 5x^2 + 2x^7 \Big|_0^1 = 7$$

Checking:  $T(\vec{b}) - T(\vec{a}) = 1^2 + 4 \cdot 1 \cdot 1 + 2 \cdot 1 \cdot 1^2 = 7$

Enif. Plus 1.35:

a) Show  $\int_S f(\vec{\nabla} \times \vec{A}) \cdot d\vec{a} = \int_S [\vec{A} \times \nabla f] \cdot d\vec{a} + \int_V f \vec{\nabla} \cdot d\vec{a}$

$$\int_S f(\vec{\nabla} \times \vec{A}) \cdot d\vec{a} = \int_S f \epsilon_{ijk} \partial_j A_k da_i$$

$$= \int_S \epsilon_{ijk} \partial_j (f A_k) da_i = \underbrace{\int_S \epsilon_{ijk} A_k \partial_j f da_i}_{\text{Stokes}}$$

↓ Stokes

$$\int_V f \vec{\nabla} \cdot d\vec{a} - \int (\nabla f \times \vec{A}) \cdot da_i \quad \text{end}$$

b)  $\int_V \vec{B} \cdot (\vec{\nabla} \times \vec{A}) d\tau = \int_V \vec{A} \cdot (\vec{\nabla} \times \vec{B}) d\tau + \int (\vec{A} \times \vec{B}) \cdot d\vec{a}$

$$\int_V \vec{B} \cdot (\vec{\nabla} \times \vec{A}) d\tau =$$

$$\int_V B_i \epsilon_{ijk} \partial_j A_k d\tau =$$

$$\int_V \epsilon_{ijk} \partial_j (B_i A_k) d\tau - \int \epsilon_{ijk} A_k \partial_j B_i d\tau$$

$$\int_V \epsilon_{jki} \partial_j (A_k B_i) d\tau - \int \epsilon_{ijk} (\partial_j B_i) A_k d\tau$$

$$= \int_V \nabla \cdot (A \times B) d\tau + \int (\vec{\nabla} \times \vec{B}) \cdot \vec{A} d\tau$$

↓ Gauss

$$\int (\vec{A} \times \vec{B}) \cdot d\vec{a}$$

thus we have

$$\int_V \vec{A} \cdot (\vec{\nabla} \times \vec{B}) d\tau + \int (\vec{A} \times \vec{B}) \cdot d\vec{a}$$

problem
